

# Savvy Suds

beer recommendations, courtesy of  
15,000 craft beer nerds

# there are tons of delicious beers to try

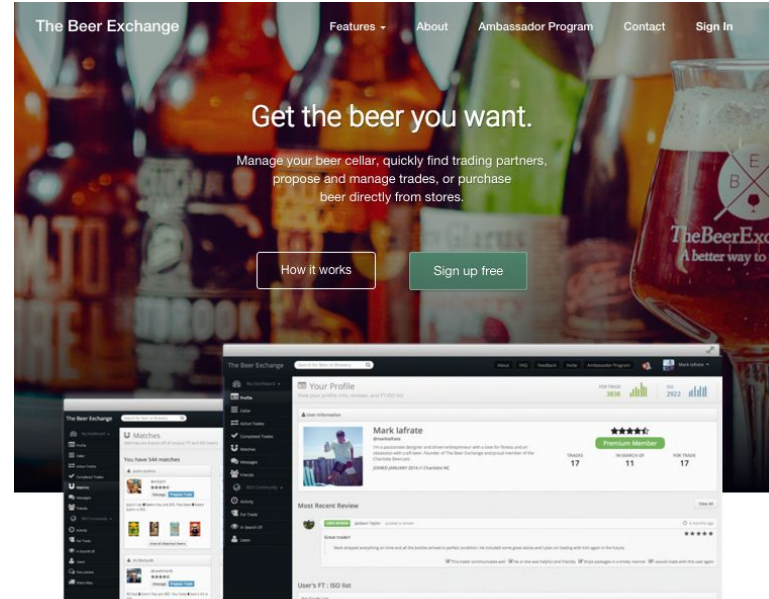

Breweries in the U.S.

but distribution is limited

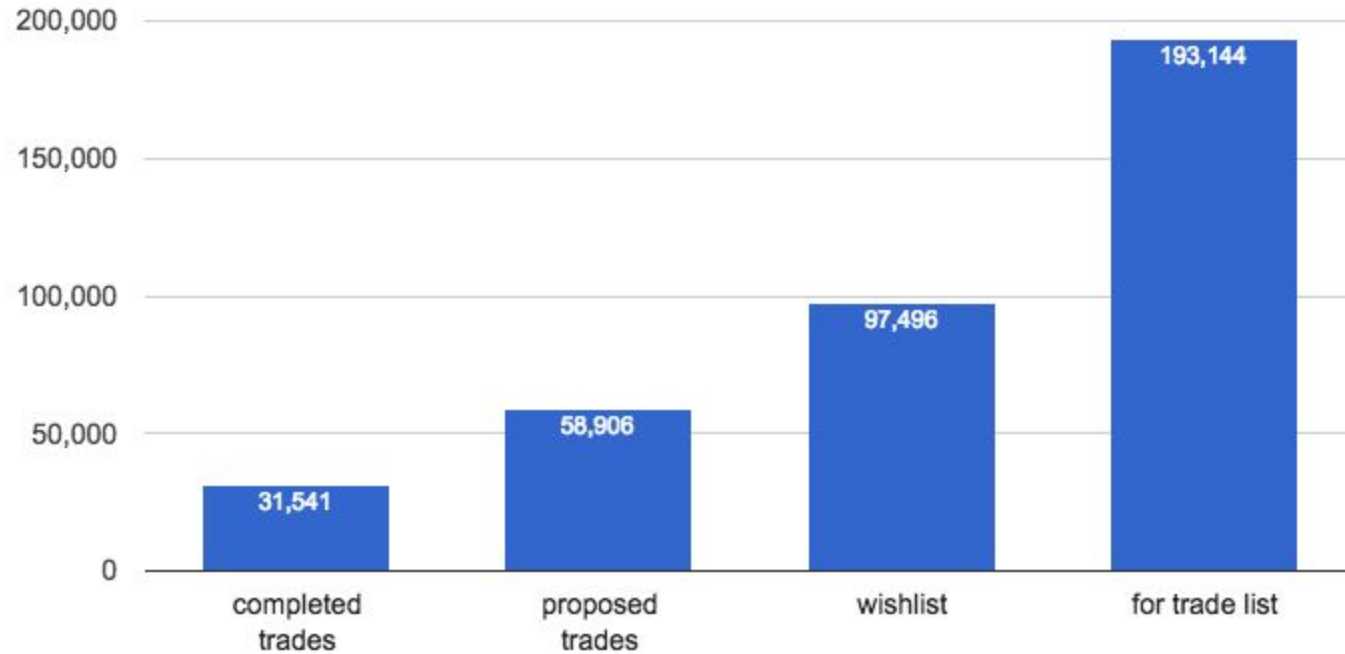

# so my friend made a beer trading app

Custom built to make trading easier.

Available on the web and from your mobile device, BEX has all the functionality you need to track your beer cellar and find the beers you want.

# he has beer wishlists

from the hipsterest of beer nerds

but no recommender

# so I built a recommender!

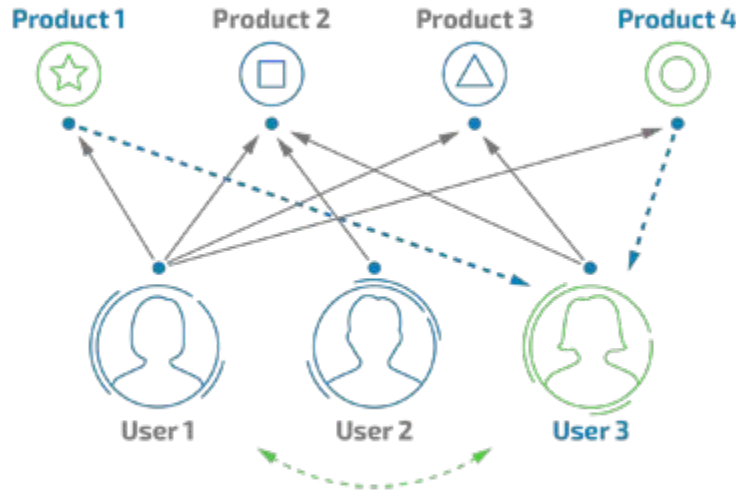

# I tried fitting a bunch of models

- Non-negative matrix factorization
- Ratings implied by user interactions
- Included item side data

# turns out, one of the simplest performed best

- Trade data only
- Item-based collaborative filtering
- Jaccard similarity to penalize popularity

recommenders are super hard to test

but these recs look pretty darn good

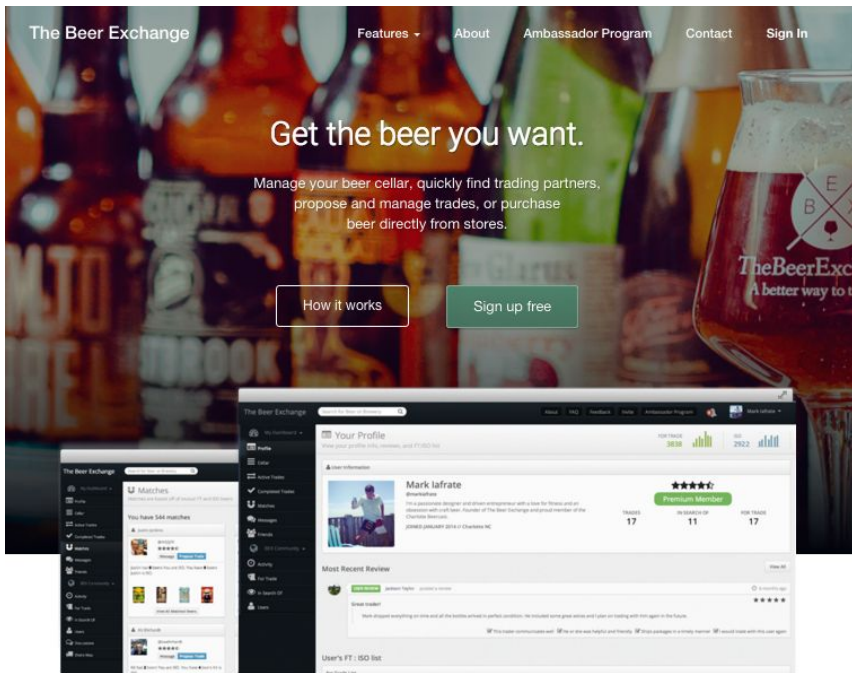

ŷhat

(by Magic Hat)

plus, I'll have real users for a/b testing

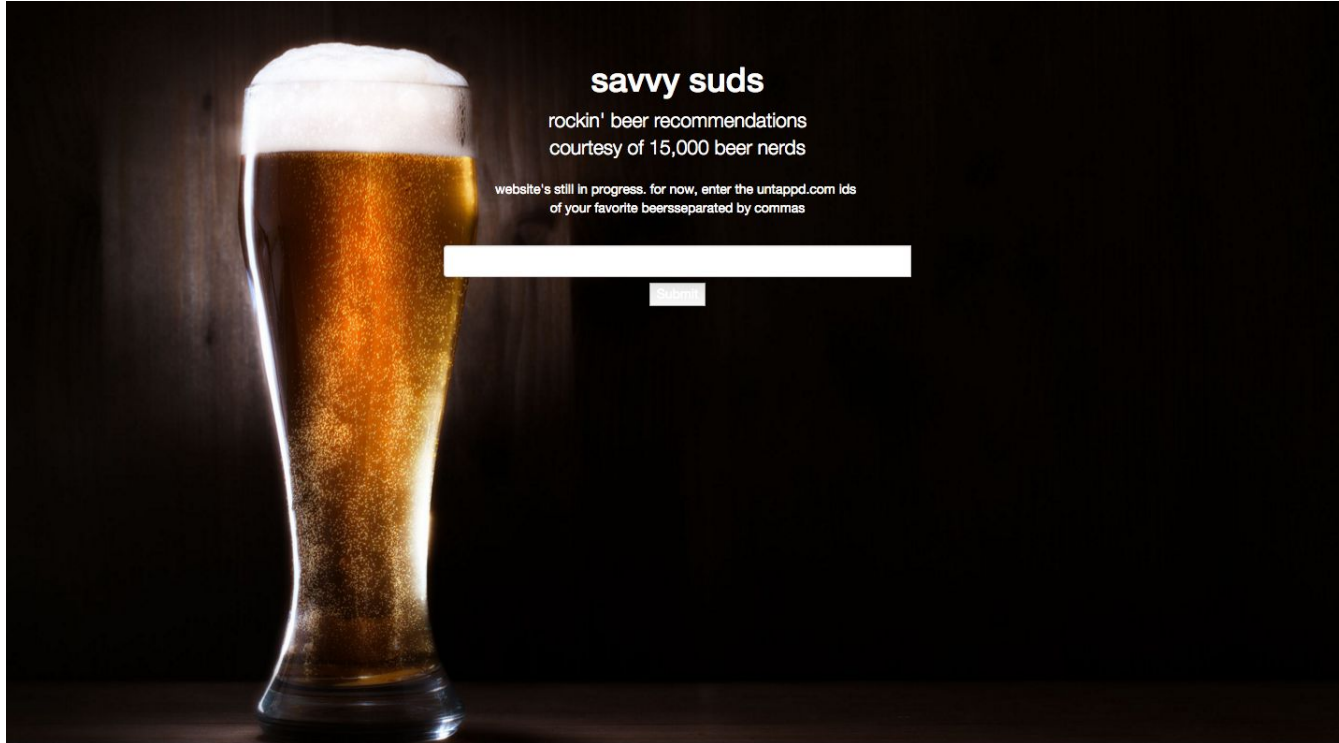

Custom built to make trading easier.

Available on the web and from your mobile device, BEX has all the functionality you need to track your beer cellar and find the beers you want.

if you're getting thirsty...

# you can find the app on the internet
